# VERTI-LINE SERIES T10-A PANEL OVERVIEW

## T10A PANEL PROFILE

### SUBSTRATE

T10A panel is designed to be utilized over open structural framing, but can easily be used with a solid substrate. The recommended substrate is 5/8" plywood with a 30 pound felt moisture barrier. To avoid panel distortion, use a properly aligned and uniform substructure.

### COVERAGE

Each panel has a coverage of 28".

### LENGTH

Lengths under 5'-0" are available with some cutting restrictions. Please consult your Metal Sales branch for maximum panel lengths and recommendations (see PGI-2 and PGI-3 for locations).

### AVAILABILITY

Panels are available in 24 through 18 gauge. Minimum quantities may apply. Custom capabilities include:

- Perforated panels for wind screens and liner panels.
- Depth of panel.

### APPLICATION

Commercial, Industrial, and Architectural panels.

### FASTENING SYSTEM

Direct Fastened (exposed).

### FASTENERS

The fastener selection guide should be consulted for choosing proper fasteners for specific applications. Quantity and type of fastener must meet necessary loading and code requirements (see PGI-12-14).

### MATERIALS

Steel grade 50, per ASTM A-792. Optional material: stainless steel, weathering steel, copper, and aluminum.

### FINISH

- ▶ \*Acrylic Coated Galvalume® (ACG) / ASTM A-792 - AZ55
- ▶ Prepainted Galvalume / ASTM A-792 - AZ50
- ▶ MS Colorfast45®
- ▶ \*\*Fluorocarbon (PVDF)
- ▶ Multi-Pass Kynar
- ▶ Marbilique
- ▶ Plastisol
- ▶ Polyester

\* Differential appearance of Acrylic Coated Galvalume roofing materials is not a cause for rejection.

\*\* Meets both Kynar 500 and Hylar 5000 specifications.

# VERTI-LINE SERIES T10-C PANEL OVERVIEW

## T10C PANEL PROFILE

### SUBSTRATE

T10C panel is designed to be utilized over open structural framing, but can easily be used with a solid substrate. The recommended substrate is 5/8" plywood with a 30 pound felt moisture barrier. To avoid panel distortion, use a properly aligned and uniform substructure.

### COVERAGE

Each panel has a coverage of 30".

- Theoretical section properties have been calculated per AISI 2001. "Specifications for the Design of Cold-formed Steel Structural Members." Ixx and Sxx are effective section properties for deflection and bending.
- Allowable load is calculated in accordance with AISI 2001 specifications considering bending, shear, combined bending and shear and deflection. Allowable load considers both 3 and 4 equal span conditions. Allowable load does not address web crippling or fasteners/support connection. Panel weight is not considered.
- Deflection consideration is limited by a maximum deflection ratio of L/180 of span.
- Allowable loads do not include a 1/3 stress increase in uplift.

**GENERAL INFORMATION**

► **Substructure**

T10-A Panels are designed to be utilized over open structural framing or a solid substrate.

► **Coverage**

T10-A Panels are available in a 1 1/2" depth with a coverage width of 28".

► **Length**

Minimum factory cut length is 5'-0".  
Maximum available panel length is 32'-0".

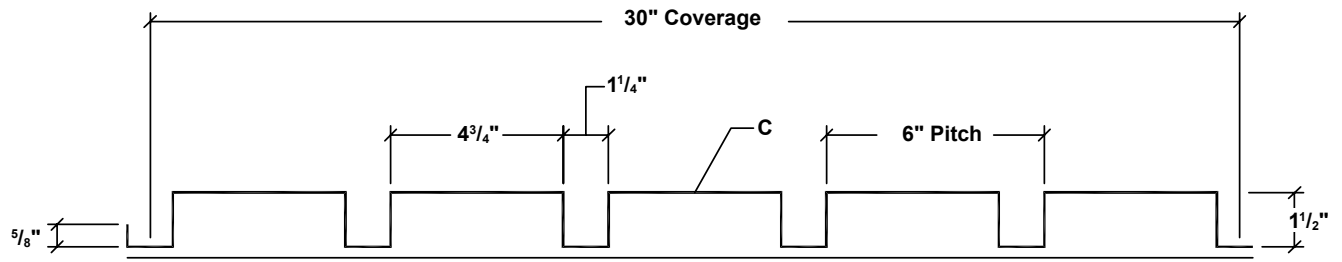

► **Fasteners**

The fastener selection guide should be consulted for choosing the proper fastener for specific applications. Quantity and type of fastener must meet necessary loading and code requirements.

*NOTE: All panels are subject to surface distortion due to improperly applied fasteners. Overdriven fasteners will cause stress and induce oil canning across the face of the panel at or near the point of attachment.*

► **Availability**

*Finishes:* Kynar 500 (PVDF) standard; optional: multi-pass Kynar, Marblique, Plastisol, Polyester, and MS Colorfast45<sup>®</sup> (SMP)  
*Gauges:* 24ga, 22ga, 20ga and 18ga

optional: multi-pass Kynar, Marblique, Plastisol, Polyester, and MS Colorfast45® (SMP)  
Gauges: 24ga, 22ga, 20ga and 18ga

**FASTENER INSTALLATION TECHNIQUE**

**Recommended Tool Type** - Use depth locating nose or adjustable clutch on screw gun to prevent overdrilling and strip out. **Do not use impact tools or runners.**

**Seating the washer** - Apply sufficient torque to seat the washer - do not overdrive the fastener.

	<b>CORRECT</b> Sealing material slightly visible at edge of metal washer. Assembly is watertight.	<b>TOO LOOSE</b> Sealing material is not visible; not enough compression to seal properly.	<b>TOO TIGHT</b> Metal washer deformed; sealing material pressed beyond washer edge.
<b>SELF DRILLER</b>			
<b>WOODSCREW</b>			

**To prevent wobbling** - Make sure fastener head is completely engaged in the socket. If the head does not go all the way in the socket - tap the magnet deeper into the socket to allow full head engagement. Metal chips will build up from drilling and should be removed from time to time.

**Protect drill point** - Push only hard enough on the screw gun to engage clutch. This prevents excess friction and burn out of the drill point. Correct pressure will allow screw to drill and tap without binding.

**Drilling through sheet and insulation** - Ease up on pressure when drilling through insulation to avoid striking the purlin or girt with the point - apply more pressure after drill point contacts purlin or girt.

**Drilling through purlin overlaps** - Drilling through lapped purlins requires extra care. Excessive voids between purlins sometimes damages drill points and two self-drillers might be necessary to complete the operation. It is sometimes advantageous to predrill.

**CONDITION OF SUBSTRUCTURE**

Whether over solid substrate or open structural framing, panel distortion may occur if not applied over properly aligned and uniform substructure.

The installer should check the roof deck for squareness before installing Verti-Line panels. Several methods can be used to verify squareness of the structure for proper installation of the panels.

**METHOD "A"** - One method for checking the roof for squareness is to measure diagonally across one slope of the roof from similar points at the ridge and eave and obtain the same dimension.

**METHOD "B"** - The 3-4-5 triangle system may also be used. To use this system measure a point from the corner along the edge of the roof at a module of three (3). Measure a point from the same corner along another edge at a module of four (4). Then by measuring diagonally between the two points established, the dimension should be exactly a module of five (5) to have a square corner. Multiple uses of this system may be required to determine building squareness. If the endwall cannot be made square, the roof system cannot be installed as shown in these instructions.
